Automatically protecting documents, saved to a specific location |

Introduction

The secure2trust folder monitor, monitors specific folders and sub-folders: applying pre-specified protection policies to documents that are placed in those folders.

When a file is created in, copied or moved to the monitored folder, it will be protected controlling access and content usage based on a specific security template, the latter being created by the secure2trust Manager.

This security template contains settings that control who can access a document and what they can do with the content of the document after access. The protection is persistently applied to the document and once protected, even if that document is removed from the monitored folder, it will remain protected.

The Folder Monitor runs as a service and so can be used both on desktops and servers.

Benefits of using the secure2trust Folder Monitor

Feature	Benefit
Runs as a service	Allows centralised application of security policies
Persistent security	Security not based just on location, once protected the documents will remain protected both inside and outside the monitored folder
